

Printing Segment Briefing

Eleven fiscal quarters of HP's own published numbers. Prepared as practice for the EMEA Home Print Category interview, not as advice for the team that already knows this business.

A top-down method, applied the same way twice

PR

Public filings, nothing else

HP's own quarterly press releases for segment revenue and margin, SEC EDGAR 10-Q and 10-K filings (CIK 47217) for regional revenue, which never appears in a press release at all.

↔

Two reporting bases, never mixed

HP restated FY24 and FY25 when it moved Print as a Service into Printing. The same quarter now has two published figures, kept side by side and never summed together.

✓

Eight validation checks

Internal consistency, matched against the exact change HP itself published when it restated older quarters, and two checks that test the segment and regional datasets against each other rather than against themselves.

↓

Broad to narrow, every layer

Total company first, then region and segment side by side, then business unit. Both dashboards in this project follow that exact shape, and so does this deck. Never built the other direction.

11

fiscal quarters, Q1 FY24 through Q3 FY26

253

segment rows, each with a source URL

8 / 8

validation checks passing

The two-year trend is down. The margin isn't.

PRINTING REVENUE, TRAILING TWELVE MONTHS, BY QUARTER

-4.48%

Trailing twelve month Printing revenue, Q4 FY24 to Q3 FY26. The real two year trend once quarterly seasonality is removed. Eight points, not eleven, because a twelve month window needs four quarters of history behind it.

18.1%

Printing operating margin, Q3 FY26. Held in a narrow 17.0% to 18.7% band across every quarter margin is disclosed for, even as revenue kept declining.

12.53%

Total HP revenue growth, year over year, Q3 FY26. Personal Systems is growing fast enough to lift the whole company even as Printing declines on its own, the same mix shift behind the falling share shown later in the Printing overview.

Americas and EMEA move like a seesaw, quarter after quarter

SHARE OF TOTAL HP REVENUE, BY QUARTER

-0.94

Quarter over quarter correlation between Americas' and EMEA's share of total revenue. One rises, the other falls, same quarter.

-0.73 vs +0.45

Same correlation, Americas vs APJ and EMEA vs APJ. If this were just three shares summing to 100%, all pairs would look similarly negative. They don't, EMEA and APJ drift together.

-3.0pp / +2.5pp

Americas' and APJ's net change, Q1-Q3 basis, FY24 vs FY26. EMEA's net change is +0.5pp, near flat. The seesaw and the two year trend are different stories.

The limit of public data. HP discloses revenue by region company wide, and by business unit globally, never the two crossed. EMEA Printing revenue isn't in any public filing.

Printing's share of HP is falling, and Supplies is carrying most of the recent decline

33.2% → 25.0%

Printing's share of total HP revenue, Q1 FY24 to Q3 FY26. Personal Systems grew faster. This is a mix shift, not a Printing collapse.

64.8% / 28.1% / 7.0%

Supplies, Commercial Printing and Consumer Printing's share of Printing revenue, Q3 FY26. Composition barely moves, Supplies runs 64.3% to 66.8% across all eleven quarters.

81%

Printing revenue fell 90 million year over year at Q3 FY26 (4,002 to 3,912). Supplies alone accounts for 73 million of that drop, 81%. Commercial Printing (-12) and Consumer Printing (-5) barely moved.

PRINTING AS A SHARE OF TOTAL HP REVENUE, BY QUARTER

Revenue and profit split very differently. Personal Systems is 75% of segment revenue but only 43% of its operating profit. Printing is 25% of revenue and 57% of profit, more dollars, 709M versus 537M, from a fifth the revenue base, at four times the margin.

Three things noticed while pulling the numbers, not while reading the headlines

The analysis on every other slide is mine. These three were flagged by Claude Code during the extraction and reconciliation pass, worth showing separately rather than folding quietly into my own reading.

CONSUMER PRINTING

Units fell **9.0%** while revenue fell only **1.8%**, a roughly seven point gap. Both numbers only exist in the release's prose, never in a table, so this only turns up by reading the narrative carefully.

CURRENCY

A weakening dollar added an estimated **1 to 2 points** to Printing's reported growth in every FY26 quarter disclosed so far, found by comparing nominal growth against constant currency growth in the same release.

CROSS-CHECK

The FY26 restatement moved a loss making activity into Printing in the same move: revenue revised **up**, earnings before taxes revised **down** by 39 million across FY25. Only visible by reconciling two separately restated tables against each other, not from reading either one alone.

What I'd actually want to ask

- ❓ Where does the seasonality in these numbers actually come from, both regional and by business unit? I can see the strong and weak quarters in the data, especially the swings between Americas and EMEA, but not what's driving them.

- ❓ Is Printing's shrinking share of HP actually about underperformance, or is it just Personal Systems being pulled along by the new AI PC demand?

- ❓ I looked at bringing in competitor data but couldn't find anything matching on currency and fiscal calendar, so I left it out. What do you actually use here, Circana or NIQ, and does it come in daily, weekly, or monthly?

- ❓ Is Copilot or other AI tooling actually changing what a BI analyst does day to day on your team? And do you actually have the Power BI licensing that includes Copilot integration?
